INTRODUCTION. A wound is a disruption of the normal structure and function of the skin and skin architecture [] . An acute wound has normal wound physiology, and healing is anticipated to progress through the normal stages of wound healing, whereas a chronic wound is defined as one that is physiologically impaired []. To ensure proper healing, the wound bed needs to be well vascularized, free of ...
a desired location; this pressure is transferred to the walls of blood vessels, causing them to become temporarily occluded or restricted.
